Researchers told 20 AI models to skip a safety step

What a one-line safety reminder fixed, and what it left.

Swipe →

Viktor Simunović, MD

NO REMINDER

16.6%

of responses picked a potentially harmful option

More than 10 million responses to clinical scenarios with an unsafe instruction built in.

WITH A REMINDER

10.1%

after one short safety reminder in the prompt

16.6% to 10.1% is 6.5 percentage points, about a 39% relative drop. Lower in **19 of 20** models.

THE LIMITS

Better is still not safe

Four fixed answer options, tidier than real practice. Prompt injection and other agent risks weren't tested. The lead author says a reminder doesn't replace clinical review.

YOUR TURN

Would you trust an AI tool that gets this wrong 1 time in 10?

Yes or no in the comments.
